FS-TST 2.0: Forensic Software
Testing Support Tools
Test Summary Report

April 25, 2005

Serban I. Gavrila
VDG Inc.
Abstract

This NIST Internal Report deals with Release 2.0 of a software package, Forensic Software Testing Support Tools (FS-TST 2.0), developed to aid the testing of disk imaging tools typically used in forensic investigations. The package includes programs that initialize disk drives, detect changes in disk content, and compare pairs of disks. This Internal Report consists of three parts.

Part A, Test Plan, Test Design Specifications, and Test Case Specification, is a companion document. It covers the planning, design, and specification of testing of FS-TST 2.0. The setup of disk drives and the testing is to be performed in the Linux environment; however, some tests will require interaction with the MS-DOS operating system.

This is Part B, Test Summary Report. It reports the result of testing the FS-TST 2.0 package according to Part A. Two programs might have had slightly more convenient behavior in erroneous cases, but no anomalies were found in testing.

Part C, Code Review Report, is an additional companion document. It covers the planning and specification of reviewing all the source code in the package and reports the results of the code reviews. Nothing was found in the code reviews that should cause invalid results, that is, that should lead to an imaging tool with systematic errors being incorrectly passed as adhering to the assertions.

The reader of this document should be familiar with the Linux operating system, computer operation, and computer hardware components such as hard drives.

Keywords: Computer forensic tool; disk imaging; software testing; testing support tools; FS-TST.

Certain trade names and company products are mentioned in the text or identified. In no case does such identification imply recommendation or endorsement by the National Institute of Standards and Technology, nor does it imply that the products are necessarily the best available for the purpose.

    3.2.13 Disk Logging Test Results Summary .........................................................191
A portion of this work was funded by the National Institute of Justice (NIJ) through an interagency agreement with the NIST Office of Law Enforcement Standards.
1 Summary

1.1 Items tested
We tested the forensic software testing support tools (FS-TST) version 2.0 (for Linux systems), namely: diskwipe, partab, diskchg, seccmp, partcmp, diskcmp, corrupt, logsetup, logcase, adjcmp, diskhash, and sechash.

The following document contains the requirements and user manual for the FS-TST 2.0 tools:

The test plan, test design specifications, and test case specifications are included in the following document:

1.2 Environment
The tests were run in the National Institute of Standards and Technology (NIST) Computer Forensics Tool Testing (CFTT) Laboratory. This section describes the hardware (host computers and hard disk drives) and the software, other than FS-TST, used in the setup, running, and examination of the results of the test cases.

1.2.1 Hardware used for testing

<table>
<thead>
<tr>
<th>Host Computers:</th>
</tr>

1.2.2 Software used for testing
Disk Editor (diskedit), Version 8.0, Symantec Corporation.
Disk Editor (diskedit), Norton Utilities 2002, Symantec Corporation.
Linux 8.2 Operating System.
Fedora Core 3 (Red Hat) Operating System.
NIST Forensics Software Testing Support Tools FS-TST 1.0 (for DOS)
NIST Computer Forensic Reference Data Sets (CFReDS) script cal-drive.csh (see
http://www.cfreds.nist.gov/) and two variants of this script, cal-drive-count.csh and cal-
drive-count-seek.csh.

2 Variances
No variances were made from the test plan or the test design specification.

3 Summary of Results
Each FS-TST 2.0 tool passed all tests.

3.1 Observations
Some observations were made during testing. These are collected here.

Because the design of partition table entries in the file system have a limited number of
bits, C/H/S start and end addresses cannot express more than 1023 cylinders and C/H/S
addresses above 1023 cylinders are incorrect in the partition table. Tools such as partab
accurately report the contents of the partition table.

If the partition table has invalid information, like cases pcm-07 and pcm-08, partcmp
could have detected the erroneous condition earlier and produced messages which were
more helpful to the user.

3.2 Test Case Results
The table below provides a description of the headings used in the test results summaries:

<table>
<thead>
<tr>
<th>Heading</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Line:</td>
<td>Test case id, name and version of the software tool tested.</td>
</tr>
<tr>
<td>Case Summary:</td>
<td>Test case summary extracted from the document Test Design Specification for the tool under test.</td>
</tr>
<tr>
<td>Tester Name:</td>
<td>Name or initials of person executing the test procedure.</td>
</tr>
<tr>
<td>Test Date:</td>
<td>Time and date that test was started.</td>
</tr>
<tr>
<td>PC:</td>
<td>Name and BIOS of computer where the tool under test was executed.</td>
</tr>
<tr>
<td>Disks:</td>
<td>Description of the hard disks used in the test as the source, destination, and media. Sometimes we attached the BIOS-assigned drive number in hexadecimal, as well as the Linux device name.</td>
</tr>
<tr>
<td>Execute:</td>
<td>Documentation of each command executed during the test.</td>
</tr>
<tr>
<td>Log files and location:</td>
<td>Name and location of the log files in the test file archive.</td>
</tr>
<tr>
<td>Log File Highlights:</td>
<td>Selected entries from the test case log files.</td>
</tr>
<tr>
<td><strong>Expected Results:</strong></td>
<td>Expected results as listed in the document <em>Test Design Specification</em> for the tool under test.</td>
</tr>
<tr>
<td>-----------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Actual Results:</strong></td>
<td>List of anomalies observed.</td>
</tr>
<tr>
<td><strong>Analysis:</strong></td>
<td>Whether or not the expected results were achieved.</td>

| Expected results: | The user is prompted to confirm the selection of an alternate log file name, which conflicts with the –src option. The log records are appended to the existing log file “dkwlog.txt”. Required information is logged. The source disk is initialized correctly. |
| Actual results: | No anomalies detected. |
| Analysis: | Expected results achieved. |

---

**Case Dkw-08**

| Case summary: | test whether *diskwipe* creates a new log file with a name given in the -log_name option, even though a log file with the same name exists and the -new_log option is used. |
| Tester name: | Serban |
| Test date: | Fri Apr 1 17:16:40 2005 |
| PC: | Mcmillan |
| Disks: | Destination: /dev/sda, external label “3B”, model MAG3091L SUN9.0G, serial # 02464303 |
| Execute: | Run *diskwipe*: diskwipe dkw-08 mcmillan serban /dev/sda 5B -noask -new_log -log_name dkwlog.txt |
| Log files location: | Test-archive/diskwipe/dkw-08 |
| Log file highlights: | *dkwlog.txt*: diskwipe @(#) diskwipe.c Linux Version 1.4 Created |
Expected results: A new log file with the alternate name “dkwlog.txt” is created, although an old one with the same name exists. Required information is logged. The disk is initialized correctly.

Actual results: No anomalies detected.

Analysis: Expected results achieved.

### 3.2.2 Partab Test Results Summary

<table>
<thead>
<tr>
<th>Case Ptb-01</th>
</tr>
</thead>
</table>
| **Case summary:** Run *partab* on a (SCSI) disk with no partition table or with an empty partition table (all 4 entries of the MBR partition table empty). Use:
- the –all option to list all entries, even empty;
- the –comment option with one-word comment. |
| **Tester name:** Serban |
| **Test date:** Sun Apr 3 12:15:27 2005 |
| **PC:** McMillan |
| **Disks:** /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF. |
| **Execute:** Run *partab* twice: first when the disk has no partition table, then when the disk has a partition table with all entries empty:
- partab ptb-01 mcmillan serban /dev/sda CC -all -comment NoTable
- partab ptb-01 mcmillan serban /dev/sda CC -all -comment EmptyTable |
| **Log files location:** Test-archive/partab/ptb-01 |
| **Log file highlights:** |

| run finish Sun Apr  3 12:31:47 2005 |
| elapsed time 0:0:0 |
| Normal exit |

**Expected results:**

*Partab* creates a log file with the name specific for the hard disk drive used in test case, “pt-sda-log.txt”. It appends the log record for the second command to the
same log file created by the first `partab` command. `Partab` logs all required information, including the fact that no partition table was found, or that all 4 entries are empty.

Actual results: No anomalies detected.
Analysis: Expected results achieved.

**Case Ptb-02**

**Case summary:** Run `partab` on a (SCSI) disk with a primary FAT16 partition on it. Use:
- the `-all` option to list all entries, even empty;
- the `-new_log` option to create a new log file although one with the same name already exists;
- the `-comment` option with a multi-word comment.

**Tester name:** Serban
**Test date:** Sun Apr 3 12:42:58 2005
**PC:** McMillan
**Disks:** `/dev/sda`, external label “CC”, model ST336705LC, serial # 3DE03HL30008110CEHF.

**Execute:** Run `partab`:
```
partab ptb-02 mcmillan serban /dev/sda CC -new_log -all -comment "Primary FAT16 partition"
```

**Log files location:** Test-archive/partab/ptb-02

**Log file highlights:**
```

run start Sun Apr  3 12:55:33 2005
run finish Sun Apr  3 12:55:47 2005
elapsed time 0:0:14
Normal exit

Expected results: 
Partab appends the log records to the existing log “pt-sda-log.txt” created in the previous case. It displays the FAT32 partition entry information correctly, as well as the empty entries. It logs all required information.

Actual results: No anomalies detected.
Analysis: Expected results achieved.

Case Ptb-04

Case summary: Run `partab` twice on an IDE disk with a primary NTFS partition on it: first using only the `–all` option, so that we can test whether the log file name changes accordingly to the hard disk drive used in the test case; then using the `–log_name` option to specify an alternate log file name.

Tester name: Serban
Test date: Sun Apr 3 13:14:39 2005
PC: McMillan
Disks: /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.

Execute: Run `partab` twice:

```
partab ptb-04 mcmillan serban /dev/hdb 7F –all
partab ptb-04 mcmillan serban /dev/hdb 7F -all -log_name ptblog.txt
```

x secondary extended partition
run start Sun Apr 3 13:14:03 2005
run finish Sun Apr 3 13:14:22 2005
elapsed time 0:0:19
Normal exit

Expected results:
When run for the first time, partab creates a new log file “pt-hdb-log.txt” for the device /dev/hdb. The second command creates a log file with the alternate name “ptblog.txt”. In both cases, partab displays the NTFS partition entry information correctly, as well as the empty entries. It logs all required information.

Actual results: No anomalies detected.
Analysis: Expected results achieved.

---

**Case Ptb-05**

**Case summary:** Run partab on an IDE disk with large (>8GB) primary FAT32 and Linux Ext2 partitions, and a Linux swap partition. Use:
-the –log_name option to specify the same alternate log file name as in the previous case – in order to test whether the log records are appended to the existing log file;
-the –all option.

**Tester name:** Serban
**Test date:** Sun Apr 3 18:47:35 2005
**PC:** McMillan
**Disks:** /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.
**Execute:** Run partab:

partab ptb-05 mcmillan serban /dev/hdb 7F -all -log_name ptblog.txt

**Log files location:** Test-archive/partab/ptb-05
**Log file highlights:** **Ptblog.txt:**

## Case Ptb-06

### Case summary:
Run `partab` on an IDE disk with a primary FAT16 partition, a primary FAT32 hidden partition, a primary HPFS hidden partition, and a primary unformatted partition. Use:
- the `--new_log` option and the `--log_name` option to specify the same alternate log file name as in the previous case – in order to test whether `partab` creates a new log file with the same alternate name if one already exists.
- the `--all` option.

### Tester name:
Serban

### Test date:
Sun Apr 3 19:04:17 2005

### PC:
McMillan

### Disks:
`/dev/hdb`, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.

### Execute:
Run `partab`:
```
partab ptb-06 mcmillan serban /dev/hdb 7F -all -new_log -log_name ptblog.txt
```

### Log files location:
Test-archive/partab/ptb-06

### Log file highlights:
**Ptblog.txt:**
```
partab @(#) partab.c Linux Version 1.4 Created 03/21/05 at 09:09:30

### Case Ptb-07

**Case summary:** Run `partab` on a SCSI with a variety of primary and logical partitions: a primary FAT32, a primary Linux Ext2, a primary extended partition, which contains logical partitions FAT16, FAT32, and NTFS.

- Use: `-the –new_log option;`
- `-the –all option.`

**Tester name:** Serban

**Test date:** Sun Apr 3 18:49:45 2005

**PC:** McMillan

**Disks:** /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.

**Execute:** Run `partab`:

partab ptb-07 mcmillan serban /dev/sda CC -all -new_log

**Log files location:** Test-archive/partab/ptb-07

**Log file highlights:**

Pt-sda-log.txt:

Expected results: Diskchg creates a log file “cg-sda-xlog.txt”, whose name reflects the device (/dev/sda in this case) and the function tested (x, i.e., exam). It displays the sectors correctly. It logs all required information.

Actual results: No anomalies detected.

Analysis: Expected results achieved.

Case Dch-02

Case summary: Test the –exam function of diskchg on a hard disk on the same Linux device as in the previous case (in order to test that diskchg appends the log records to an existing log file. Use:
-the –exam option;
-the –comment option with a multi-word comment.

Tester name: Serban

Test date: Sun Apr 3 09:48:54 2005

PC: McMillan

Disks: /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.

Execute: Run diskchg:

diskchg dch-02 mcmillan serban /dev/sda -exam -comment “Test -exam, append log records”

When prompted, enter LBA and C/H/S addresses for sectors at the end of a track and the beginning of the next track.

Log files location: Test-archive/diskchg/dch-02

Expected results:  
Diskchg creates a new log file cg-sda-xlog.txt.
It detects the sector addresses that are beyond the disk end
and issues some error message.
It logs all required information.

Actual results:  
No anomalies detected.

Analysis:  
Expected results achieved.

Case Dch-04

Case summary:  
Test the –read function of diskchg on a SCSI hard disk.
Use:
-the –read option with a sector LBA address, offset, and
length.

cmd: diskchg dch-04 mcmillan serban /dev/sda -read 80388 0 32  
TEST dch-04 HOST mcmillan OPERATOR serban  
Comment: Test the -read function |
| Expected results: | `Diskchg` creates a new log file cg-sda-rlog.txt, whose name reflects the function used (“r”) and the Linux device.  
`Diskchg` displays the sector content correctly.  
It logs all required information. |
| Actual results: | No anomalies detected. |
| Analysis:      | Expected results achieved. |
### Case Dch-05

| Case summary: | Test the `--read` function of `diskchg` on a SCSI hard disk. Use:  
| | -the `--read` option with a sector C/H/S address, but with an offset too large;  
| | -the `--new_log` option. |

| Tester name: | Serban |
| Test date: | Sun Apr 3 10:00:57 2005 |
| PC: | McMillan |
| Disks: | `/dev/sda`, external label “CC”, model ST336705LC, serial #3DE03HL300008110CEHF. |

#### Execute:

Run `diskchg`:

```
diskchg dch-05 mcmillan serban /dev/sda -new_log -read 5/1/1 640 32
```

#### Log files location:

`Test-archive/diskchg/dch-05`

#### Log file highlights:

cmd: diskchg dch-10 mcmillan serban /dev/sda -read 5/1/1 0 32
TEST dch-10 HOST mcmillan OPERATOR serban
Comment: Read modified sector

Expected results: Diskchg creates a new log file cg-sda-flog.txt, whose name reflects the tested function (“f”) and the Linux device. Diskchg fills the specified sector as it would fill the second specified sector in the specified geometry.
It logs all required information.

**Actual results:** No anomalies detected.

**Analysis:** Expected results achieved.

### Case Dch-13

**Case summary:** Test the –write function of *diskchg* on a SCSI hard disk, with the sector address specified in the C/H/S format.

**Use:**
- the –write option to modify a byte at a specified offset in a sector specified by its C/H/S address;
- the –new_log option.

**Tester name:** Serban

**Test date:** Sun Apr 3 10:38:31 2005

**PC:** McMillan

**Disks:** /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL30008110CEHF.

**Execute:** Run *diskchg* three times: 1) to read original sector content; 2) to fill the sector as another sector in the new geometry; and 3) to read the modified sector:

```bash
diskchg dch-13 mcmillan serban /dev/sda -new_log -read 5/1/1 0 32
diskchg dch-13 mcmillan serban /dev/sda -new_log -write 5/1/1 26 CE
diskchg dch-13 mcmillan serban /dev/sda -read 5/1/1 0 32
```

**Case Dch-15**

| Case summary: Test the –write function of diskchg on a SCSI hard disk, with the sector address outside the disk range. |
| Use: |
| -the –write option with a byte address beyond the disk end; |
| -the –new_log option. |
| Tester name: Serban |
| Test date: Sun Apr  3 10:42:18 2005 |
| PC: McMillan |
| Disks: /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF. |
Execute: Run `diskchg`:

```
diskchg dch-15 mcmillan serban /dev/sda -new_log -write
71687370 26 DD
```

Log files location: Test-archive/diskchg/dch-15

Log file highlights:

```
**Cg-sda-wlog.txt:**

  - Usage: diskchg test-case host operator drive [-options]
  - -comment "..." Give comment on command line
  - -exam Prompt for sectors to print
  - -read addr offset length
    - Print <length> bytes starting at
<offset> from sector at <addr>
-write addr offset new_value
  Replace byte at
  <offset> in sector at <addr> with <new_value> (in
  hex)
-fill addr fill_addr heads new_value
  Fill sector at <addr>
  in DISKWIPE style for address <fill_addr> using a
  disk geometry
  of <heads> heads with fill byte of <new_value> (in
  hex)
  if <heads> is zero, then number of heads on disk is
  used
-zero addr
  Set all bytes of sector at <addr> to zero
  <addr> can be specified as either an LBA address (an
  integer)
  or as cylinder/head/sector (three slash separated
  integers)
-new_log Start a new log file (default is append to old
  log file)
-log_name <name> Use different log file (default is
  chglog.txt)
-h Print this option list

| **Execute:** | Fill first sectors diskwipe-style, then change one byte in each, using `diskchg`:

```
  diskchg scm-01 mcmillan serban /dev/sda -fill 0 0 0 CC
  diskchg scm-01 mcmillan serban /dev/sda -write 0 30 01
  diskchg scm-01 mcmillan serban /dev/hdb -fill 0 0 0 7F
  diskchg scm-01 mcmillan serban /dev/hdb -write 0 30 01
```

Run `seccmp`:

```
  seccmp scm-01 mcmillan serban /dev/sda CC /dev/hdb 7F -sector 0 0 -comment CompareNonFilledSectors
```

| **Log files location:** | Test-archive/seccmp/scm-01/ |
| **Log file highlights:** | Seclog.txt:

`seccmp` @(#) seccmp.c Linux Version 1.3 Created 03/18/05 at 14:39:56
compiled on Mar 25 2005 at 19:16:47 using gcc Version 3.3.3 20040412 (Red Hat Linux 3.3.3-7)

--------------------------------------------------------

run start Mon Apr 4 17:14:49 2005
run finish Mon Apr 4 17:14:49 2005
elapsed time 0:0:0
Normal exit

Expected results: Seccmp creates a new log file “seclog.txt”. It compares the
sectors specified in the –sector option and displays the
differences.
It logs all the required information correctly.

Actual results: No anomalies detected.
Analysis: Expected results achieved.

Case Scm-02
Case summary: Compare last sectors of each disk (source SCSI, destination
IDE) that are diskwipe-filled. Use:
-the –sector option;
-the –comment option with a multi-word comment;
-the previous log file to append the log records.

Tester name: Serban
Test date: Mon Apr 4 17:21:54 2005
PC: McMillan
Disks: Source: SCSI, /dev/sda, external label “CC”, model

Page 66 of 193
ST336705LC, serial # 3DE03HL300008110CEHF.

Dest: IDE, /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.

Execute:
Fill last sectors of each disk diskwipe-style using `diskchg`:

diskchg scm-02 mcmillan serban /dev/sda -new_log -fill 71687369 71687369 0 CC

diskchg scm-02 mcmillan serban /dev/hdb -new_log -fill 78177791 78177791 0 7F

Run `seccmp`:
seccmp scm-02 mcmillan serban /dev/sda CC /dev/hdb 7F -sector 71687369 78177791 -comment "Compare diskwipe-filled sector, append log"

Log files location: Test-archive/seccmp/scm-02/

run start Mon Apr  4 17:26:26 2005
run finish Mon Apr  4 17:26:38 2005
elapsed time 0:0:12
Normal exit

Expected results: Seccmp creates a new log file “seclog.txt” although a log file with the same name already exists. It detects the invalid addresses and issues some error message. It logs all the required information correctly.

Actual results: No anomalies detected.
Analysis: Expected results achieved.

---

**Case Scm-04**

**Case summary:** Compare different combinations of diskwipe-style filled sectors (same or different fill value, same or different headers – i.e., LBA and C/H/S), when the fill values specified on the command line are identical. Use:
-interactive specification of sector addresses;
-interactive comment;
-the –new_log option,
-same fill value for both drives on the command line.

### Case Scm-05

**Case summary:** Compare different combinations of diskwipe-style filled sectors (same or different fill value, same or different headers – i.e., LBA and C/H/S), when the fill values specified on the command line are different. Use:
- interactive specification of sector addresses;
- interactive comment;
- the –new_log option;
- different fill values for the source and destination drives on the command line.

**Tester name:** Serban

**Test date:** Mon Apr 4 17:47:43 2005

**PC:** McMillan

**Disks:**
- **Source:** SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.
- **Dest:** IDE, /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.

**Execute:**
- Use `diskchg` to fill sectors:
  - `diskchg scm-05 mcmillan serban /dev/sda -fill 1000 1000 0 CC`
  - `diskchg scm-05 mcmillan serban /dev/sda -fill 1001 1001 0 CD`
  - `diskchg scm-05 mcmillan serban /dev/sda -fill 1002 1002`
Run seccmp:
seccmp scm-05 mcmillan serban /dev/sda CC /dev/hdb 7F -new_log

and submit the following sector pairs when prompted:

Case Scm-07

Case summary: Test whether seccmp displays its usage mode when invoked with the –h option.

Tester name: Serban

Test date: Mon Apr 4 18:00:00 2005

PC: McMillan

Disks: None.

Execute: Run seccmp and capture its standard output into a file:

seccmp > output.txt
seccmp scm-07 mcmillan serban /dev/sda –logname >> output.txt
seccmp –h >> output.txt
seccmp scm-07 mcmillan serban /dev/sda CC /dev/hdb 7F –h >> output.txt

Log files location: Test-archive/seccmp/scm-07

Log file highlights: output.txt:
<table>

Normal exit

Expected results: Partcmp creates a new log file “cmpptlog.txt”. It logs the comment and the other information as required. It displays the partition table entries and assigns them indexes. It prompts the user for indexes. It compares the partitions indicated by the user through their indexes, and displays the result, including the number and range of different and equal sectors. For the destination partition, which is larger, it categorizes the surplus sectors.

Actual results: No anomalies detected.
Analysis: Expected results achieved.

Case Pcm-02
Case summary: Compare large primary FAT32 partitions, where the source partition is bigger than the destination partition and
they have *almost* the same contents on the smaller length. Select the partitions to compare by using the –select option. Also compare the boot tracks for those partitions, by using the –boot option.

Test how `partcmp` creates a new log file with the default name although a log file with the same name exists, logs a multi-word comment entered on the command line, logs the disks and the partitions, and logs the program execution.

| Tester name: | Serban |
| Test date: | Tue Apr  5 15:25:58 2005 |
| PC: | McMillan |
| Disks: | Source: SCSI, `/dev/sda`, external label “CC”, model ST336705LC, serial # 3DE03HL30008110CEHF.  
Destination: IDE, `/dev/hdb`, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770. |

**Execute:** Modify a few sectors in the source partition by using `diskchg` (we assume the partitions had the same contents on the smaller length):

```bash
diskchg pcm-02 mcmillan serban /dev/sda -fill 1000 1000 0 AA 
diskchg pcm-02 mcmillan serban /dev/sda -zero 2000 
diskchg pcm-02 mcmillan serban /dev/sda -write 3000 30 AA
```

Run `partcmp`:

```
partcmp pcm-02 mcmillan serban /dev/sda CC /dev/hdb 7F -select 1 1 -boot -comment "Compare FAT32 slightly different, src > dst" -new_log
```

**Log files location:** Test-archive/partcmppcm-02

### Expected results:

*Partcmp* creates a new log file with the name “pcmlog.txt”. It prompts the user for a comment, logs the comment, disks, partitions, prompts the user to select the partitions to be compared. It logs the other information as required.

It compares the partitions selected by the user, including the boot tracks, and displays the result, including the number and range of different and equal sectors.

### Actual results:

No anomalies detected.

### Analysis:

Expected results achieved.

---

### Case Pcm-05

**Case summary:** Compare logical Fat32 partitions with the same size and slightly different contents. Also compare the boot tracks for those partitions, by using the –boot option.

Test whether *partcmp* appends the log records to an existing log file with an alternate name when using the –log_name option.

**Tester name:** Serban

**Test date:** Tue Apr 5 16:55:30 2005

**PC:** McMillan

**Disks:**

- **Source:** IDE, /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.

- **Destination:** SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF

**Execute:** Modify a few sectors of the source partition by using *diskchg*:

```
  diskchg pcm-05 mcmillan serban /dev/hdb -fill 40966813 40966813 0 AA
  diskchg pcm-05 mcmillan serban /dev/hdb -fill 40967813 40967813 0 AA

Expected results: Partcmp creates a new log file “pcmlog.txt”, although a file with the same name already exists.
It prompts the user for a comment, logs the comment, disks, partitions, prompts the user to select the partitions to be compared. It logs the other information as required. It compares the partitions selected by the user, including
the boot tracks, and displays the result, including the number and range of different and equal sectors. It categorizes the surplus destination sectors.

### Case Pcm-07

**Case summary:** Test whether `partcmp` detects invalid partition indexes, for example, indexes that point to empty partition table entries.

**Tester name:** Serban  
**Test date:** Tue Apr 5 17:04:00 2005  
**PC:** McMillan

**Disks:**  
Source: IDE, /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.  
Destination: SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF

**Execute:** Run `partcmp` with partition indexes pointing to empty partition table entries:

```
partcmp pcm-07 mcmillan serban /dev/hdb 7F /dev/sda CC -boot -new_log -select 8 8
```

**Log files location:** Test-archive/partcmp/pcm-07

**Log file highlights:**

Expected results: *Partcmp* issues an error message and terminates execution.

Actual results: No anomalies detected.

Analysis: Expected results achieved.

### Case Pcm-08

**Case summary:** Test whether *partcmp* detects invalid partition indexes, for example, indexes that *do not point* to a partition table entry.

**Tester name:** Serban

**Test date:** Tue Apr 05 17:06:00 2005

**PC:** McMillan

**Disks:**
- **Source:** IDE, /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.
- **Destination:** SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF

**Execute:** Run *partcmp* with partition indexes that do not point to any partition table entries:

```
partcmp pcm-08 mcmillan serban /dev/hdb 7F /dev/sda CC -boot -new_log -select 9 9
```

**Log files location:** Test-archive/partcmp/pcm-08

**Log file highlights:**

```

Expected results achieved.
### Diskcmp Test Results Summary

**Case Dcm-01**

**Case summary:**
Compare IDE/SCSI hard disk drives, when the source drive is larger than the destination drive, and they have the same contents on the smaller size. Also, test how diskcmp creates a log file with the default name, logs a one-word comment entered on the command line, logs the disks, the comparison result, and the program execution.

**Tester name:** serban

**Test date:** Wed Apr  6 09:38:33 2005

**PC:** McMillan

**Disks:**
- **Source:** IDE, /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.
- **Destination:** SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.

**Execute:**
Run `diskcmp` to compare the disks:

```bash
diskcmp dcm-01 mcmillan serban /dev/hdb 7F /dev/sda CC -comment CompareDisks
```

**Log files location:** Test-archive/diskcmp/dcm-01/

**Log file highlights:**

```plaintext
Cmplog.txt:
diskcmp @(#) diskcmp.c Linux Version 1.2 Created 02/18/05 at 08:49:40

(3DE03HL300008110CEHF)
Sectors compared: 71687370
Sectors match: 71687370
Sectors differ: 0
Bytes differ: 0
Diffs range
Source (78177792) has 6490422 more sectors than
destination (71687370)
0 source read errors, 0 destination read errors
run start Wed Apr 6 09:38:33 2005
run finish Wed Apr 6 10:42:32 2005
eelapsed time 1:3:59
Normal exit

Expected results: Diskcmp creates a new log file with the default name
“cmplog.txt”. It logs the comment, the drives, and the
other information required.
Diskcmp compares the disks and logs the number of
sectors compared, and the number of equal and different
sectors.

Actual results: No anomalies detected.

Analysis: Expected results achieved.

Case Dcm-02

Case summary: Compare SCSI/IDE hard disk drives, when the source
drive is smaller than the destination drive, and they have
almost the same contents on the smaller size.
Also, test how diskcmp appends the log records to an
existing log file with the default name, logs a multi-word
comment entered on the command line, logs the disks, the
comparison result, and the program execution.

Tester name: serban
Test date: Wed Apr 6 11:23:49 2005
PC: McMillan

Disks: Destination: SCSI, /dev/sda, external label “CC”, model
ST336705LC, serial # 3DE03HL300008110CEHF.

Source: IDE, /dev/hdb, external label “7F”, model
MAXTOR 6L040J2, serial # 662201137770.

Execute: Modify a few sectors of the source disk (we assume that
the drives had the same contents on the smaller size):
Run `diskcmp` to compare the disks:

```
diskcmp dcm-02 mcmillan serban /dev/sda CC /dev/hdb 7F -comment "Compare disks, src<dst, almost equal contents, append log"
```

Log files location: Test-archive/diskcmp/dcm-02

destination (78177792)
Zero fill: 3
Src Byte fill (CC): 0
Dst Byte fill (7F): 6490419
Expected results:  

**Diskcmp** appends the log records to the existing log file with the default name “cmplog.txt”. It logs the comment, the drives, and the other information required. **Diskcmp** compares the disks and logs the number of sectors compared, and the number of equal and different sectors. It categorizes the destination surplus sectors.

Actual results: No anomalies detected.

Analysis: Expected results achieved.

### Case Dcm-03

Case summary: Compare IDE hard disk drives with the same size, filled in diskwipe-style with the same value, and with a few different sectors at known addresses. Also, test whether **diskcmp** creates a new log file with the default name although a file with the same name already exists, by using the –new_log option. Test whether **diskcmp** prompts the user for a comment, logs the comment, disk drives, and other information required, compares the drives, logs the comparison result and the program execution.

Tester name: Serban  
Test date: Thu Apr 7 07:17:36 2005  
PC: McMillan  
Disks: Source: IDE, /dev/hdb, external label “82”, model WDC WD800BB-00CAA1, serial # WD-WCA8E5277475.  
Destination: IDE, /dev/hdd, external label “80”, model WDC WD800BB-00CAA1, serial # WD-WCA8E5174999.

Execute: Initialize both disks with the same value 0x82. Note: for the success of this test case, you need to check whether
*diskwipe* detects and uses the same geometry for both disks; if not, you have to use the –heads option.

```
diskwipe dcm-03 mcmillan serban /dev/hdb 82 –src
diskwipe dcm-03 mcmillan serban /dev/hdd 82 –dst
```

Modify a few sectors of the destination disk:

```
diskchg dcm-03 mcmillan serban /dev/hdd -fill 0 0 0 AA
diskchg dcm-03 mcmillan serban /dev/hdd -write
156301487 511 AA
diskchg dcm-03 mcmillan serban /dev/hdd -zero
100000000
```

Run *diskcmp* to compare the disks:

```
diskcmp dcm-03 mcmillan serban /dev/hdb 82 /dev/hdd 82 -new_log
```

Destination Drive /dev/hdd
09728/254/63 (max cyl/ hd values)
09729/255/63 (number of cyl/ hd)
156301488 total number of sectors
IDE disk: Model (WDC WD800BB-00CAA1) serial #
Expected results: \textit{Diskcmp} creates a new log file with the default name “cmplog.txt, although a log file with the same name already exists. It prompts the user for a comment. It logs the comment, the drives, and the other information required. \textit{Diskcmp} compares the disks and logs the number of sectors compared, and the number of equal and different sectors.

Actual results: No anomalies detected.

Analysis: Expected results achieved.

Fill a few sectors of the destination disk with the same value as the one used for the source, using the same geometry (255):

diskchg dcm-04 mcmillan serban /dev/hdd -fill 1000000 1000000 255 82
diskchg dcm-04 mcmillan serban /dev/hdd -fill 2000000 2000000 255 82
diskchg dcm-04 mcmillan serban /dev/hdd -fill 3000000 3000000 255 82

Run `diskcmp` to compare the disks:

diskcmp dcm-04 mcmillan serban /dev/hdb 82 /dev/hdd 80 –log_name diskcmplog.txt

Log files location: Test-archive/diskcmp/dcm-04

</tr>
<tr>
<td>Normal exit</td>
</tr>
</tbody>
</table>

**Expected results:**

*Diskcmp* creates a new log file with the alternate name “diskcmplog.txt”. It prompts the user for a comment. It logs the comment, the drives, and the other information required. *Diskcmp* compares the disks and logs the number of sectors compared, and the number and range of equal and different sectors.

**Actual results:** No anomalies detected.

**Analysis:** Expected results achieved.

### 3.2.7 Corrupt Test Results Summary

<table>
<thead>
<tr>
<th>Case Cor-01</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Case summary:</strong> Test whether <code>corrupt</code> alters the first byte of an image file, creates a log file with the default name, logs a comment entered on the command line, logs the program execution, the original and altered byte value, and all other information required by the specifications. Use the –comment option with a one-word comment.</td>
</tr>
<tr>
<td><strong>Tester name:</strong> Serban</td>
</tr>
<tr>
<td><strong>Test date:</strong> Thu Apr 14 06:53:45 2005</td>
</tr>
<tr>
<td><strong>PC:</strong> McMillan</td>
</tr>
<tr>
<td><strong>Disks:</strong> Media: IDE, /dev/hdd, external label “80”, model WDC WD800BB-00CAA1, serial # WD-WCA8E5174999. Mounted on directory /media.</td>
</tr>
</tbody>
</table>
| **Execute:** Run `corrupt`:

```bash
corrup cor-01 mcmillan serban /media/imgfile 0 41 -comment AlterFirstByte
```

Compare the altered file “imgfile” with the reference copy:

```bash
cmp -l /media/imgfile /media/copy-of-imgfile > diff.txt
```

Note: The byte offset in cmp’s output starts with 1. The byte values are listed in octal.

| **Log files location:** Test-archive/corrupt/cor-01/ |

**Diff.txt:**
```
1 101  60
```

**Expected results:**
*corrupt* creates a new log file with the default name “corlog.txt”. Alters the first byte of the image file as requested. Logs the comment, the original and new values of the altered byte, and the other information required.

**Actual results:**
No anomalies detected.

**Analysis:**
Expected results achieved.

---

### Case Cor-02

**Case summary:**
Test whether *corrupt* alters the last byte of an image file, appends the log records to an existing log file with the default name, logs a multi-word comment entered on the command line, logs the program execution, the original and altered byte value, and all other information required by the specifications.

**Tester name:** Serban
**Test date:** Thu Apr 14 07:59:25 2005
**PC:** McMillan
**Disks:** Media: IDE, /dev/hdd, external label “80”, model WDC WD800BB-00CAA1, serial # WD-WCA8E5174999. Mounted on directory /media.

**Execute:**
Run *corrupt*:
```
corrupt cor-02 mcmillan serban /media/imgfile 17247252479 41 -comment “Alter last byte, append log”
```

Compare the altered file “imgfile” with the reference copy:
```
cmp -l /media/imgfile /media/copy-of-imgfile > diff.txt
```

Note: The byte offset in cmp’s output starts with 1. The byte values are listed in octal.

Start LBA  End LBA  Length  Size: MB (binary)
Expected results: *Adjcmp* creates a new log file “cmpalog.txt”. It logs the comment, the drives, the program execution, the partition tables of each drive, the location, size, type of each disk chunk. It logs all other information required (compilation date, libraries, etc.)

Actual results: No anomalies detected.

Analysis: Expected results achieved.
in a natural assignment order;
- compares the assigned chunks and records the correct results;
- categorizes surplus destination chunks, when the first source chunks have the same type, size, and contents as the assigned destination chunks, and the destination drive has surplus chunks.

run finish Mon Mar 28 16:31:22 2005
elapsed time 0:37:8
Normal exit

Expected results:  *Adjcmp* creates a new log file “cmpalog.txt”, although a file with the same name already exists. It logs the comment, the drives, the program execution, the partition tables of each drive, the location, size, type of each disk chunk. It assigns the source chunks to the destination chunks in a natural way, compares them and logs the correct results, then categorizes the sectors of the surplus destination chunks. It logs all other information required (compilation date, libraries, etc.)

Actual results:  No anomalies detected.
Analysis:  Expected results achieved.

</tbody>
</table>

### Case Acm-04

**Case summary:** Test whether `adjcmp` allows the user to specify an alternate log file name by using the `–log_name` option. Test how `adjcmp` automatically assigns surplus source chunks. Use for comparison the same partitions as before, but reverse the source and destination disks, so that the source disk has surplus chunks. Also, modify a few sectors in some or all partitions, so that they do not compare equal.

<table>
<thead>

</tr>
</tbody>
</table>

**Execute:** Run `adjcmp`:

```
adjcmp acm-04 mcmillan serban /dev/sda CC /dev/hdb 7F –log_name adjcmplog.txt
```

**Log files location:** Test-archive/adjcmp/acm-04

**Log file highlights:**

`Adjcmplog.txt`:

```
adjcmp @(#) adjcmp.c Linux Version 1.4 Created 03/25/05 at 19:16:24
compiled on Mar 25 2005 at 19:16:46 using gcc Version 3.3.3 20040412 (Red Hat Linux 3.3.3-7)
@(#) zbios.c Linux Version 1.5 Created 03/21/05 at 09:09:12
support lib compiled Mar 25 2005 at 19:16:46
@(#) zbios.h Linux Version 1.1 Created 02/10/05 at 10:53:24
cmd: adjcmp acm-04 mcmillan serban /dev/sda CC /dev/hdb 7F -log_name adjcmplog.txt
TEST acm-04 HOST mcmillan OPERATOR serban
Comment: Compare partitions with a few differences, see how an excess chunk is handled.

Expected results:  *Adjcmp* creates a log file with the alternate name “adjcmplog.txt”. It prompts the user for a comment. It logs the comment, the drives, the program execution, the partition tables of each drive, the location, size, type of each disk chunk. It automatically assigns the source chunks to the destination chunks in a natural way, compares them and logs the correct results. It logs all other information required (compilation date, libraries, etc.) The documentation does not specify how the surplus source chunks should be assigned, if they would at all.

Actual results: No anomalies detected. The surplus source chunks are all assigned to the destination chunk 0, which happens to be the boot track of the first partition.

Analysis: Expected results achieved.

---

**Case Acm-05**

Case summary: Test how the user can assign source chunks of type U (unallocated) when there are no destination chunks of that type. Also, test whether *adjcmp* correctly (i.e., according to the specifications) compares large primary and logical partitions in both cases src size < dst size and src size > dst size.

Tester name: serban

Test date: Wed Mar 30 10:24:15 2005

PC: McMillan

Disks:

Source: IDE, /dev/hdb, external label “7F”, model MAXTOR 6L040J2, serial # 662201137770.

Destination: SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.

Execute: Run *adjcmp*:

```
adjcmp acm-05 mcmillan serban /dev/hdb 7F /dev/sda CC –assign –new_log
```

When prompted, assign unallocated source chunks to destination chunk 0. Assign each source P chunk to the destination chunk of the same type (i.e., primary FAT32 to primary FAT32, etc.)

Log files location: Test-archive/adjcmp/acm-05

Unallocated 1  12279000 diffs  12279000  
Total src sectors 67607049  
Partition excess 4080510 zero 191846 non-zero 3888664  
Disk excess 0 zero 0 non-zero 0  
Total dst sectors 71687559  

run start Wed Mar 30 10:24:15 2005
Expected results: *Adjcmp* creates a new log file with the default name “cmpalog.txt”. It prompts the user for a comment. It logs the comment, the drives, the program execution, the partition tables of each drive, the location, size, type of each disk chunk. It prompts the user for chunk assignment. It compares the chunks according to specification (observe whether it categorizes surplus destination sectors) and logs the results. It logs all other information required (compilation date, libraries, etc.)

Actual results: No anomalies detected.

Analysis: Expected results achieved.

### Case Acm-06

<p>| Case summary: | Test whether <em>adjcmp</em> displays its usage mode when invoked with the –h option. |
| Tester name: | serban |
| Test date: | Wed Mar 30 16:11:00 2005 |
| PC: | McMillan |
| Disks: | None. |
| Execute: | Run <em>adjcmp</em> with the –h option alone on the command line or accompanied by other arguments and capture its standard output into a file: |
| | adjcmp -h &gt; outputlog.txt |
| | adjcmp acm-06 mcmillan serban /dev/hdb 7F /dev/sda CC -h &gt;&gt; outputlog.txt |
| Log files location: | Test-archive/adjcmp/acm-06 |
| Log file highlights: | <strong>outputlog.txt:</strong> |
| | adjcmp Version 3.1 compiled at 19:16:46 on Mar 25 2005 |
| | Src drive /dev/hdb dst drive /dev/sda |
| | Src fill 0x7F dst fill 0xCC |
| | Usage: adjcmp test-case host operator src-drive src-fill dst-drive dst-fill [-options] |
| | -comment &quot;...&quot; Descriptive comment |
| | -layout Print disk layout only (no compare) |
| | -new_log Start a new log file (default is append to old log file) |
| | -log_name &lt;name&gt; Use different log file (default is cmpalog.txt) |
| | -assign Assign corresponding regions between src |</p>

### 3.2.11 Sechash Test Results Summary

<table>
<thead>
<tr>
<th>Case Shs-01</th>
</tr>
</thead>
</table>
| **Case summary:** | Test whether *sechash*:
| | - creates a new log file with the default name reflecting the
| | –before option;
| | - logs a one-word comment entered on the command line
| | in the –comment option;
| | - logs the disk drive;
| | - logs the program execution;
| | - logs the block of sectors for which it will compute the
| | hash, and the type of hash;
| | - computes and logs the SHA-1 hash of the entire disk
| | when –first, –last, and -hash options are omitted. |
| **Tester name:** | serban |
| **Test date:** | Sat Apr 16 10:47:40 EDT 2005 |
| **PC:** | McMillan |
| **Disks:** | Target: SCSI, /dev/sda, external label “CC”, model
| | ST336705LC, serial # 3DE03HL300008110CEHF. |
| **Execute:** | Run sechash.csh script: |
| | sechash.csh shs-01 mcmillan serban /dev/sda CC -before -comment HashEntireDisk |
| **Log files location:** | Test-archive/sechash/shs-01/ |
| **Log file highlights:** | hashbsec.txt: |
| | @(#) sechash.csh Linux Version 1.8 Created 03/18/05 at
| | 11:11:24
| | CMD: /root/Forensic/bin/sechash.csh shs-01 mcmillan
| | serban /dev/sda CC -before -comment HashEntireDisk
| | Case: shs-01 |
| | Host: mcmillan |
| | User: serban |
| | Device: /dev/sda |
| | Label: CC |
| | Comment: HashEntireDisk |
| | Hash: sha1sum |
| | Linux mcmillan 2.4.20-8 #1 Thu Mar 13 17:54:28 EST
| | 2003 i686 i686 i386 GNU/Linux |
| | shasum (coreutils) 4.5.3 |
| | SCSI device sda: 71687370 512-byte hdwr sectors (36704 MB)
| | Hash 71687370 sectors from 0 through 71687369
| | (dd bs=512 if=/dev/sda skip=0 count=71687370 | sha1sum
Expected results: 
*Sechash* creates a new log file “hashbsec.txt”. It logs the comment, the drive, the program execution, the block of sectors for which it will compute the hash, the type of hash computed, the actual number of sectors in the block, and the hash value. It logs all other information required (compilation date, libraries, etc.)

Actual results: No anomalies detected.

Analysis: Expected results achieved.
| Expected results: | Sechash creates a new log file “hashbsec.txt”. It logs the comment, the drive, the program execution, the block of sectors for which it will compute the hash, the type of hash computed, the actual number of sectors in the block, and the hash value. It logs all other information required (compilation date, libraries, etc.). |
| Actual results: | No anomalies detected. |
| Analysis: | Expected results achieved. |

**Case Shs-03**

**Case summary:**
- Test whether sechash:
- creates a log file with the default name reflecting the –after option;
- prompts the user to enter a comment;
- logs the disk drive;
- logs the program execution;
- logs the block of sectors for which it will compute the hash.
hash, and the type of hash; -computes and logs the SHA-1 hash (explicitly specified by the –hash option, even though it is the default type of hash) of the entire disk when the –first and –last option explicitly specify the first and last sectors of the disk, and the last byte of the disk pattern of case shs-01 was modified by using diskchg.

| Tester name: | serban |
| Test date: | Sat Apr 16 11:52:14 EDT 2005 |
| PC: | McMillan |
| Disks: | Target: SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF. |
| Execute: | Run sechash.csh script: |
| | sechash.csh shs-03 mcmillan serban /dev/sda CC –new_log -after -first 0 -last 71687369 -hash sha1sum |

User: serban  
Device: /dev/sda  
Label: CC  
Comment: Hash entire disk, with modified last byte, MD5  
Hash: md5sum  
Linux mcmillan 2.4.20-8 #1 Thu Mar 13 17:54:28 EST 2003 i686 i686 i386 GNU/Linux  
md5sum (coreutils) 4.5.3  
SCSI device sda: 71687370 512-byte hdwr sectors (36704 MB)  
Hash 71687370 sectors from 0 through 71687369  
(dd bs=512 if=/dev/sda skip=0 count=71687370 | md5sum | tr a-z A-Z >> hashasec.txt ) >& hashasec.txt  
71687370+0 records in  
71687370+0 records out  
4E39B4D4E813A7C6A1E90637B0A281FD  
run start Sat Apr 16 12:34:38 EDT 2005  
run finish Sat Apr 16 12:52:11 EDT 2005  

Expected results:  
**Sechash** creates a new log file “hashasec.txt”. It prompts the user for a comment. It logs the comment, the drive, the program execution, the block of sectors for which it will compute the hash, the type of hash computed, the actual number of sectors in the block, and the hash value. It logs all other information required (compilation date, libraries, etc.)  

Actual results:  
No anomalies detected. The correctness of the MD5 hash computed for the modified pattern has been assessed by comparing the hash to the hash computed in the test case dsh-05 of **diskhash**.  

Analysis:  
Expected results achieved.  

---  

**Case Shs-05**  

Case summary:  
Test whether **sechash**:  
-creates a log file with an alternate name by using the –log_name option;  
-prompt the user to enter a comment;  
-logs the disk drive;  
-logs the program execution;  
-logs the block of sectors for which it will compute the hash, and the type of hash;  
-computes and logs the SHA-1 hash (explicitly specified by the –hash option) of the first sector of the disk by using

Test date: Sat Apr 16 15:14:00 EDT 2005
PC: McMillan
Disks: Target: SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.

Execute: Run the script sechash.csh:
sechash.csh shs-12 mcmillan serban /dev/sda CC -before -new_log -first 71687370 -last 71687380 > output.txt

Log files location: Test-archive/sechash/shs-12/

Log file highlights: Output.txt:
[root@mcmillan shs-12]# sechash.csh shs-12 mcmillan serban /dev/sda CC -before -new_log -first 71687370 -last 71687380
Case shs-12 Host mcmillan User serban Device /dev/sda Label CC
Last sector (71687380) is after end of drive (71687370)
usage: sechash.csh TestCase Host User Device Label [-options]
Options:
-before Name the logfile hashblog.txt
-after Name the logfile hashalog.txt
-first <LBA> Start hashing at <LBA>
-last <LBA> Stop hashing at <LBA>
-comment <text> Record text in log
-hash <prog_name> Use <prog_name> to compute a hash
-new_log Create a new log file
-log_name <name> Name the log file <name>
-h Print this list of options

Expected results: Sechash detects the –first sector address points beyond the disk end and issues some error message.

Actual results: No anomalies detected. sechash detects the –last value is incorrect, but we considered sechash passed the test because this situation cannot occur without another error that sechash reports.

Analysis: Expected results achieved.

Case Shs-13
Case summary: Test whether sechash:
detects an invalid –last sector address, i.e., outside the LBA range of the disk.

<table>
<thead>
<tr>
<th>Tester name:</th>
<th>Serban</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

Expected results: **Sechash** displays its usage mode in each case.
Actual results: No anomalies detected.
Analysis: Expected results achieved.
### 3.2.12 Diskhash Test Results Summary

<table>
<thead>
<tr>
<th>Case Dhs-01</th>
<th></th>
</tr>
</thead>
</table>
| Case summary: | Test whether **diskhash**:  
- creates a new log file with the default name reflecting the –before option;  
- logs a one-word comment entered on the command line in the –comment option;  
- logs the disk drive;  
- logs the program execution;  
- logs the type of hash;  
- computes and logs the SHA-1 hash of the entire disk. |
| Tester name: | Serban |
| Test date: | Fri Apr 15 18:05:56 EDT 2005 |
| PC: | McMillan |
| Disks: | Target: SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF. |
| Execute: | Run the *cal-drive.csh* script to write on the disk a pattern whose SHA-1 and MD5 hashes are known:  
cal-drive.csh sda > output.txt  
Run diskhash.csh script:  
diskhash.csh dhs-01 mcmillan serban /dev/sda CC -before -comment HashDisk -hash sha1sum |
| Log files location: | Test-archive/diskhash/dhs-01/ |
| Log file highlights: | **Output.txt:**  
[root@mcmillan diskhash]# cal-drive.csh sda  
/dev/sda has 71687370 sectors  
This script will overwrite the drive on /dev/sda  
Everything on the drive /dev/sda WILL BE LOST  
Do you want to continue? [yes|no] yes  
71687370+0 records in  
71687370+0 records out  
71687370+0 records in  
71687370+0 records out  
MD5 should be: 9CF850670C1A43AF810093F7758C0277 -  
MD5 on drive is: 9CF850670C1A43AF810093F7758C0277 -  
71687370+0 records in  
71687370+0 records out  
SHA1 should be:  
EB2166A130781E350C6D71001E62DC520D68CAA2 - |
Expected results: **Diskhash** creates a new log file “hashblog.txt”. It logs the comment, the drive, the program execution, the type of hash computed, the actual number of disk sectors, computes the SHA-1 hash and logs the hash value. It logs all other information required.

Actual results: No anomalies detected. The correctness of the SHA-1 hash computed for the specified disk drive has been assessed by comparing the hash to the hash computed by the script `cal-drive.csh` used to write the pattern onto the disk.

Analysis: Expected results achieved.

Case Dhs-02

Case summary: Test whether **diskhash**:
- appends the log records to an existing log file;
- logs a multi-word comment entered on the command line in the
-comment option;  
-logs the disk drive;  
-logs the program execution;  
-logs the type of hash;  
-computes and logs the MD5 hash of the entire disk.

-----Log records of the previous case, followed by-----

@(#) diskhash.csh Linux Version 1.7 Created 03/18/05 at 11:11:24  
CMD: /root/Forensic/bin/diskhash.csh dhs-02 mcmillan serban /dev/sda CC -before -comment "Test MD5 hash" -hash md5sum  
Case: dhs-02  
Host: mcmillan  
User: serban  
Device: /dev/sda  
Label: CC  
Comment: Test MD5 hash  
Hash: md5sum  
Linux mcmillan 2.4.20-8 #1 Thu Mar 13 17:54:28 EST 2003  
i686 i686 i386 GNU/Linux  
md5sum (coreutils) 4.5.3  
SCSI device sda: 71687370 512-byte hdwr sectors (36704 MB)  
(dd bs=512 if=/dev/sda | md5sum | tr a-z A-Z >> hashblog.txt )  
>>& hashblog.txt  
71687370+0 records in  
71687370+0 records out  
9CF850670C1A43AF810093F7758C0277 -  
run start Sat Apr 16 08:57:33 EDT 2005  
run finish Sat Apr 16 09:15:11 EDT 2005  

Expected results:  
**Diskhash** appends the log records to the existing log file “hashblog.txt” created in the previous case. It logs the comment, the drive, the program execution, the type of hash computed, the actual number of disk sectors, computes the
SHA-1 hash and logs the hash value. It logs all other information required.

Actual results: No anomalies detected. The correctness of the MD5 hash computed for the specified disk drive has been assessed by comparing the hash to the hash computed by the script cal-drive.csh used to write the pattern onto the disk –see previous case dhs-01.

Analysis: Expected results achieved.

**Case Dhs-03**

Case summary: Test whether **diskhash**:
- creates a new log file although a file with the same name already exists;
- prompts the user for a comment and logs it;
- logs the disk drive;
- logs the program execution;
- logs the type of hash;
- computes and logs the SHA1 hash of the entire disk.

Tester name: Serban
Test date: Sat Apr 16 09:25:02 EDT 2005
PC: McMillan
Disks: Target: SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.

Execute: Run diskhash.csh script:

```
diskhash.csh dhs-03 mcmillan serban /dev/sda CC -before
-new_log -hash sha1sum
```

Log files location: Test-archive/diskhash/dhs-03/

Log file highlights: **hashblog.txt**:

```bash
@(#) diskhash.csh Linux Version 1.7 Created 03/18/05 at 11:11:24

run start Sat Apr 16 09:25:02 EDT 2005
run finish Sat Apr 16 09:49:59 EDT 2005

Expected results: **Diskhash** creates a new log file “hashblog.txt” although a file with the same name already exists. Prompts the user for a comment, logs the comment, the drive, the program execution, the type of hash computed, the actual number of disk sectors, computes the SHA-1 hash and logs the hash value. It logs all other information required (compilation date, libraries, etc.)

Actual results: No anomalies detected. The correctness of the SHA-1 hash computed for the disk drive was assessed by comparing the hash to the hash computed by the script *cal-drive.csh* used to write the pattern onto the disk – see case dhs-01.

Analysis: Expected results achieved.

---

**Case Dhs-04**

Case summary: Test whether *diskhash*:
- creates a log file with the name reflecting the –after option;
- prompts the user for a comment and logs it;
- logs the disk drive;
- logs the program execution;
- logs the type of hash;
- computes and logs the SHA1 hash of the disk drive used in the previous case(s) after the last byte of the last sector was modified.

**Case Dhs-05**

Case summary: Test whether **diskhash**:
- creates a log file with the alternate name specified in the –log_name option;
- prompts the user for a comment and logs it;
- logs the disk drive;
- logs the program execution;
- logs the type of hash;
- computes and logs the MD5 hash of the specified disk drive.
**Tester name:** Serban  
**Test date:** Sat Apr 16 10:24:39 EDT 2005  
**PC:** McMillan  
**Disks:** Target: SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.

**Execute:** Run diskhash.csh script:

```
diskhash.csh dhs-05 mcmillan serban /dev/sda CC -log_name diskhashlog.txt -hash md5sum
```

**Log files location:** Test-archive/diskhash/dhs-05/

**Log file highlights:**

<table>
<thead>
<tr>
<th><strong>diskhashlog.txt:</strong></th>

</tr>
<tr>
<td><code>run finish Sat Apr 16 10:43:39 EDT 2005</code></td>
</tr>
</tbody>
</table>

**Expected results:** *Diskhash* creates a new log file “diskhashlog.txt”. Prompts the user for a comment, logs the comment, the drive, the program execution, the type of hash computed, the actual number of disk sectors, computes the MD5 hash and logs the hash value. It logs all other information required (compilation date, libraries, etc.)

**Actual results:** No anomalies detected. The correctness of the MD5 hash computed for the disk drive has been assessed by comparing the hash to the hash computed by the script *cal-drive.csh* used to write the pattern onto the disk – see case dhs-01.

**Analysis:** Expected results achieved.
### Case Dhs-06

**Case summary:** Test whether `diskhash` displays its usage mode when invoked with the `–h` option.

**Tester name:** Serban

**Test date:** Sat Apr 16 10:24:39 EDT 2005

**PC:** McMillan

**Disks:** Target: SCSI, /dev/sda, external label “CC”, model ST336705LC, serial # 3DE03HL300008110CEHF.

**Execute:** Run `diskhash.csh` script without arguments, with incorrect arguments, with the `–h` option alone on the command line, and with correct arguments plus the `–h` option. Capture its standard output into a file:

```bash
diskhash.csh > output.txt
diskhash.csh dhs-05 mcmillan serban /dev/sda CC -logname >> output.txt
diskhash.csh –h >> output.txt
diskhash.csh dhs-05 mcmillan serban /dev/sda CC -log_name diskhashlog.txt -hash md5sum –h >> output.txt
```

**Log files location:** Test-archive/diskhash/dhs-06/

**Log file highlights:**

**output.txt:**

Must select `-before`, `-after`, or `-log_name <name>`

usage: diskhash.csh TestCase Host User Device Label [options]

Options:
- `before` Name the logfile hashblog.txt
- `after` Name the logfile hashalog.txt
- `comment <text>` Record text in log
- `hash <prog_name>` Use `<prog_name>` to compute a hash
- `new_log` Create a new log file
- `log_name <name>` Name the log file `<name>`
- `h` Print this list of options

**Expected results:** `Diskhash` displays its usage mode in each case.

**Actual results:** No anomalies detected.

**Analysis:** Expected results achieved.
3.2.13 Disk Logging Test Results Summary

Disk logging examines the result of three previous test cases, dkw-01, dkw-04, and dkw-09, to test that hard disk drives are logged correctly.

<table>
<thead>
<tr>
<th>Case Dkw-01</th>
</tr>
</thead>
<tbody>

<th>Serban</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test date:</td>
<td>Mar 31 16:24:14 2005</td>
</tr>
<tr>
<td>PC:</td>
<td>Mcmillan</td>
</tr>
<tr>
<td>Disks:</td>
<td>Source: /dev/hdb, external label “7F”, model MAXTOR 6L040J2 serial # 662201137770</td>
</tr>
</tbody>
</table>
| Execute:    | Run `diskwipe`:
`diskwipe dkw-04 mcmillan serban /dev/hdb 7F -src -noask`
| Log files location: | Test-archive/diskwipe/dkw-04 |

Log file highlights: `Wipeslog.txt`:

```
... Wipeslog.txt:

Wipe Drive /dev/hdb
04865/254/63 (max cyl/hd values)
04866/255/63 (number of cyl/hd)
78177792 total number of sectors
IDE disk: Model (MAXTOR 6L040J2) serial # (662201137770)
78177792 sectors wiped with 7F
run start Thu Mar 31 16:24:14 2005
run finish Thu Mar 31 17:23:32 2005
elapsed time 0:59:18
Normal exit
```

Expected results: The tool logs disk’s model and serial numbers, reasonable geometry numbers (maximum number of cylinders, heads, sectors/track, and total number of sectors), and the type of interface (IDE/non-IDE).

Actual results: No anomalies detected. The geometry, model and serial number, and interface reported coincide with those reported by the Linux OS at boot time.

Analysis: Expected results achieved.

**Case Dkw-09**

Case summary: Test whether the disk geometry, model number, and serial number are correctly reported for SATA drives.

| Execute:    | Run `diskwipe`:
`diskwipe dkw-09 frank serban /dev/sda AA -new_log -noask`
| Log files location: | Test-archive/diskwipe/dkw-09 |

Log file highlights: `dkwlog.txt`:

...
... Wipe Drive /dev/sda
30400/254/63 (max cyl/hd values)
30401/255/63 (number of cyl/hd)
488397168 total number of sectors
Non-IDE disk
Model (WDC WD2500JD-22F) serial # (WD-WMAEH2677545)
488397168 sectors wiped with AA
run start Mon Mar 28 15:44:48 2005
run finish Mon Mar 28 20:10:10 2005
elapsed time 4:25:22
Normal exit

<table>
<thead>
<tr>
<th>Expected results:</th>
<th>The tool logs disk’s model and serial numbers, reasonable geometry numbers (maximum number of cylinders, heads, sectors/track, and total number of sectors), and the type of interface (IDE/non-IDE).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Actual results:</td>
<td>No anomalies detected. The geometry, model and serial number, and interface reported coincide with those reported by the Fedora Core 3 OS at boot time.</td>
</tr>
